Object Oriented Programming

Reflection

This is a reflection for the weekly programming tasks alongside Project A and Project B. I faced an equal challenge across both projects as well as the weekly tasks but they helped me delve further into object oriented programming (OOP) and pushed me to research the key concepts and fundamentals of OOP. I included encapsulation inheritance abstraction, and polymorphism.

Weekly Programming Tasks

I do think I struggled with certain aspects especially week 5, the file is missing for week 5 as I ran into a lot of difficulties when trying to run the program and eventually ended up losing the file. The other ones tasks started out from simple outputs like hello world all the way to creating menu based systems therefore I think this part was good for me gain a good understanding of object oriented programming. I think for the most part I was successful on these programming tasks and I believe I successfully implemented the features that were required and learnt how to use important tools such as scanner. I also learnt about methods/functions and how to implement them to work across classes which ended up being really helpful in project B where there are several classes which have to work together in order to run and store inputs correctly. If I was to do this part of the assignment again I'd definitely spend more time ensuring that week 5 was complete and didn't interfere with other files

Project A

Project A was the music app, I ensured that I managed to get all the functionality required into the project. It was a relatively laid back project that utilised a majority of the skills I learnt in the weeks such as creating functions as the backbone of the project and implementing loops allowing the menu to be accessible and easy to use. I did face challenges around error handling as there was a lot of testing involved. I also would definitely go down a different path for testing, I didn't choose to do testing tables as I believed it was a relatively small project in

comparison to project B so i went through testing each function one by one instead. If i was to do this again i would get more creative with the functionality and then test it more thoroughly.

Project B

For project B this was definitely the project i struggled with the most, With the introduction of more classes and more data being saved across classes and having to implement several layers of encapsulation i believe certain parts of this project took me a lot longer than i might have liked them to. I also faced issues around error handling as some cases i believed need error handling were actually fine and functional parts of the project which actually needed to exist therefore i often created bigger problems which had to be reworked. I did like this project because it challenged me to understand how different classes work together to run a project and will definitely be useful on a larger scale

In conclusion i am happy with the result of this project and it taught me a lot about object oriented programming despite struggling, the challenge will be beneficial for the future
